Blochem. Blophys. Res. Commun. 155:622-625(1988).
-!- FUNCTION: Binds heme and transports it to the liver for breakdown and iron recovery, after which the free hemopexin returns to the circulation.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma.
                                                                                                                                         Gallus gallus (Chicken).

New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.

Claim 2; Page 67; 82pp; English

The present sequence is a specific example of claimed anti-angiogenic pentapeptides of the invention. Claimed anti-angiogenic polypeptides or peptides comprise: the histidine-proline-rich (H/P) domain of human histidine proline rich glycoprotein (HPRG, see ABB79806); an H/P domain of rabbit HPRG (see ABB79807); a variant of these that is capable of inhibiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808, such as the present peptide, or its variant having an additional 1 to 4 amino acids comprising His, Pro or Gly at its No or C-terminus. Also claimed are: chemically synthesised or

The invention relates to an isolated tropomyosin (Tpm)-related
antiangiogenic receptor polypeptide or peptide, which is a is a fragment
CC antiangiogenic receptor polypeptide or peptide, which is a surface of
c andothelial cells, or a variant of the fragment. It has a molecular mass
CC dabout 17 kDa and corresponds in its sequence to, or is a variant of,
an internal fragment of a native Tpm isoform which is a binding site for
antiangiogenic polypeptide agents; The isolated antiangiogenic receptor
CC antiangiogenic polypeptide agents; The isolated antiangiogenic receptor
polypeptide, peptide or variant has substantially the same biochemical
activity of binding to the antiangiogenic polypeptide agent that
cc native Tpm internal fragment. The antiangiogenic polypeptide agent that
binds to the isolated polypeptide or peptide is human histidine-proline
crich glycoprotein (HPRG), rabbit HPRG, a Tpm-binding, antiangiogenic
c homologue, variant, domain or fragment of human or rabbit HPRG, two chain
cc rich glycoprotein (HPRG), the DS domain of HK, or a Tpm-binding,
conditiangiogenic homologue, variant, domain or fragment of the HK or its DS
cc domain. The Tpm-related antiangiogenic receptor polypeptide or peptide,
antibodies and compositions are useful for inhibiting endothelial cell
migration, invasion, proliferation or angiogenesis, for inducing
centionethy, neovascular glaucoma, vueitis, endometriosis, arthritis,
centhopathy, neovascular glaucoma, vueitis, endometriosis, arthritis,
conditions in which
contreased angiogenesis is desired, e.g. coronary artery disease or
concern in the rabbit HPRG protein His-Pro (H/P) rich domain.
                                                                                                                                                                      New tropomyosin-related antiangiogenic receptor polypeptide, useful for inhibiting endothelial cell migration, invasion, proliferation or angiogenesis, inducing endothelial cell apoptosis, or treating tumors or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Contrast agent; cancer; cardiovascular disease; inflammation; stroke; central nervous system disorder; infection; cardiac failure; embolism; myocardial infarction; atherosclerosis; thrombosis; aneurysm; haemorrhage; Alzheimer's disease; multiple sclerosis; bone disease; osteoporosis; apoptosis; necrosis; cathepsin D.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "Pn216-succinyl. Pn216 = Bis{(1,1-dimethyl-2-N-hydroxyimine propyl) aminoethyl]-2-aminoethyl amine"

The invention relates to a contrast agent substrate (I) susceptible of changing pharmacodynamic and/or pharmacokinetic properties upon the influence of enzymatic activity. The contrast agent substrate is useful for detection of tissue or cells with abnormal metabolic activity, for identification and/or diagnosis of cancer, cardiovascular diseases, diseases on the central nervous system, inflammations, or infections and diseases on the central nervous system, inflammatic activity, where the substrate is administered to human or animal body and a contrast agent signal is detected as a result of the contrast agent changing pharmacodynamic and/or pharmacokinetic properties. The substrate is useful for manufacturing a medicament for detecting an area of disease of abnormal enzymatic activity. The contrast agent is useful in diagnosis of cardiac failure, myocardial infarction, atherosclerosis, thrombosis, embolism, aneurysms, stroke, haemorrhage, central nervous system diseases, preferably Alzheimer's disease or multiple sclerosis, bone diseases such as osteoporosis, viral infections, and for identification of apoptosis and necrosis. The metabolically sensitive contrast agents as early sign of disease/condition, the contrast agents have a potential for diagnosing disease at an early stage, which in many clinical situations are important for the outcome of stage, which in many clinical situations are important for the outcome of stage, which in many clinical situations are important for the outcome of stage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tions are important for the outcome of sensitive to treatment and can be used sequence represents the cathepsin D
                                                                                                                                                                                                                                                                                                                         Contrast agents susceptible of changing pharmacodynamic and/or pharmacokinetic properties upon enzymatic activity, useful in diagnosis of cancer, cardiovascular diseases and inflammation in humans and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

The inventor relates to numban Drain south actioning by procesh is the invention relates to numban Drain south (ASIC4). Human BNaC4 is useful for identifying compounds that modulate its activity, by measuring the for identifying compounds that modulate its activity, by measuring the for identifying compounds that modulate its activity by measuring the state of the modulator on the protein. BNaC4-dependent cytotoxicity or BNAC4-dependent activation of ion flux. Compounds discovered by screening test compounds using human BNaC4 protein is useful for treatment for a condition mediated by human BNaC4. BNaC4 antibody is useful for blocking the activity of the polypoptide. BNaC4 antibody is useful for blocking the activity of the polypoptide. BNaC4 classase, Huntington's disease, amyotrophic lateral sclerosis, cerebellar diseases, Huntington's disease, amyotrophic lateral sclerosis, cerebellar cataxias and For use as analgesics for intractable pain, complex. Conditions and for use as analgesics for intractable pain, complex. regional pain syndrome, arthritis (ostecarthritis, rheumatorid), ulcers, neurodegenerative diseases, asthma, chronic obstructive pulmonary diseases, irritable bowel syndrome, psoriaais, central nervous system classase, irritable bowel syndrome, psoriaais, central nervous system diseases, control of viscera innervated by the dorsal root ganglia and to disease, control of viscera innervated by the dorsal root ganglia and to disease, control of viscera innervated by the dorsal root ganglia and to disease, control of viscera innervated by the dorsal root ganglia and to disease, control of viscera innervated by the dorsal root gandide. There consistent in one of the DNA molecules. BNAC4 DNA is used in gene contrary. The present sequence is human BNAC4 c-terminal peptide. There were 2 bases in the BNAC4 coding sequence that were consistently consistently consistently consistent in one of 10 independent cDNA library clones. These ketc and different in one of 10 independent consistence is and the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of acid-sensing ion measuring the effect

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                           cids and polypeptides, useful for preventing diagnosing leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the encoded proteins (AAO000010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                          Human, cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human polynucleotides (AAI79941-AAI93841) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal action and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                The invention relates to an isolated tropomyosin (Tpm) related
antiangiogenic receptor polypeptide or peptide, which is a is a fragment
C antiangiogenic receptor polypeptide or peptide, which is a surface of
endothelial cells, or a variant of the fragment. It has a molecular mass
of about 17 kDa and corresponds in its sequence to, or is a variant of,
an internal fragment of a native Tpm isoform which is a binding site for
c antiangiogenic polypeptide agents; The isolated antiangiogenic receptor
polypeptide, peptide or variant has substantially the same blochemical
activity of binding to the antiangiogenic polypeptide agent that
continuty of binding to the antiangiogenic polypeptide agent that
continuty of binding to the antiangiogenic polypeptide agent that
continuty of binding to the antiangiogenic polypeptide agent that
continuty of binding to the antiangiogenic polypeptide agent that
conformed to the isolated polypeptide or peptide is human histidine-proline
conformed to the isolated polypeptide or peptide is human histidine-proline
conformed to the bold of the bold of the proposition of the propositions are useful for inhibiting endothelial cell
migration, invasion, proliferation or angiogenesis, for inducing
conforted antiangiogenic endometriosis, arthritis,
conforted antiangiogenic or peptide in a biological sample, for
contreased angiogenesis is desired, e.g. coronary artery disease or
concition which
concept artery disease. The present sequence represents a rabbit HPRG
conception HIB-Pro (H/P) rich domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                         New tropomyosin-related antiangiogenic receptor polypeptide, useful for inhibiting endothelial cell migration, invasion, proliferation or angiogenesis, inducing endothelial cell apoptosis, or treating tumors or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention relates to a substantially purified salivary Phlebotomus ariasi or Phlebotomus perniciosus polypeptide. The composition comprising the polypeptide or the nucleic acid encoding the polypeptide is useful for manufacture of a medicament. The polypeptides and nucleic acids are useful for inducing an immune response to a P. ariasi or P. perniciosus polypeptide. It is also useful for inhibiting a symptom of a Leishmania infection or preventing a Leishmania infection in a subject. The present sequence represents a purified Phlebotomus ariasi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Histidine proline rich glycoprotein; HPGP; rabbit; antiangiogenic; cytostatic; antiarteriosclerotic; antiinflammatory; antidiabetic; gynaecological; antiarthritic; antiulcer; osteopathic; antitumour; ophthalmological; nootropic; neuroprotective; antiparkinsonian; chelator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New substantially purified salivary Phlebotomus ariasi or Phlebotomus perniciosus polypeptide, useful for inhibiting, treating or preventing Leishmania infection in a subject.

The present sequence is the protein sequence of the histidine-proline-rich (HPP) domain of rabbit anti-angloganic histidine proline rich glycoprotein (HPRG, see also, ABB79806). Claimed anti-angloganic proliferidine proline rich (BPP) domain of rabbit HPRG, a variant of these that is capable of inhibiting anglogenesis, and chelial cell proliferation or endothelial cubbit HPRG, an HPP domain of rabbit HPRG, a variant of these that is capable of inhibiting anglogenesis, and chelial cell proliferation or endothelial cubbiting by propertied paving the generic sequence given in ABB79808. Also claimed are: chemicially synthesised or recombinantly produced peptide wultimers; a diagnostically useful HPRG, polypeptide, poptide or peptide multimer; and antibody specific for an epitope of HPRG that is present in the H/P domain of human or rabbit HPRG, and which binds to HPRG or to any of the domains in a way which inhibites the anti-anglogenes cell invasion, carrier; an antipody specific for an epitope of HPRG or the antibody; a method for inhibiting all mispatch, and which binds to HPRG or to any of the domain or analysen-binding fragment of the antibody; a method for inhibiting anglogenesis; a method for treating a subject having a disease or condition associated with undesired cell a biological sample; isolated nucleic acids encoding the polypeptide, peptide multimer; an expression vector; transferred cells, a method of providing to a subject; transferred cells, a method of providing to a cell; tissue or organ an anglogenesis in mibiting and method of providing to a cell; transferred cells, or the peptide multimer; an expression vector; transferred cells, or the peptide multimer; an expression vector; transferred cells, or the peptide multimer; an expression vector; transferred cells, or the peptide multimer; an expression vector; from a complex minker or peptide multimer; or solating molecule or solating molecule, or solating molec
                                                                                                                                                                                                                New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         iogenesis and are useful for promoting in pertinent disease states, and in various

New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.

Claim 1; Page 13; 82pp; English.

The present sequence is the protein sequence of the histidine-prolineCC Tich (HPP) domain of human anti-anglogenic histidine proline rich
glycoprotein (HPRG, see also ABB79804). Claimed anti-anglogenic and properties or peptides comprise: the HPP domain of human HPRG; an H/P
glycoprotein (HPRG, see ABB179804). Claimed anti-anglogenic and proliferation or endothelial of inhibiting anglogenesis, endothelial cell proliferation or endothelial cof inhibiting anglogenesis, endothelial cell proliferation or endothelial companition in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808. Also claimed are: chemically synthesised or recompinantly produced peptide multimers, a diagnostically labeled anti-anglogenic polypeptide, peptide or peptide multimer and carrier; a diagnostically useful HRRC-related composition, comprising cut the diagnostically labeled polypeptide, peptide or peptide multimer and carrier; an antibody specific for an epitope of HRRG that is present in the HRRG or the domains in a way which inhibits the anti-anglogenic activity of HRRG or the domains in a way which inhibits the anti-anglogenic activity of the domain of human or rabble HRRG, and which binds to HRRG or to and of the domain in a way which inhibits the anti-anglogenic activity of the domain and a disease or condition associated with undesired cell migration, invasion, proliferation, or anglogenesis, a method of cardiact having a disease or condition associated with undesired cell cetenting the presence of HRRG or its cleavage product or its peptide, peptide multimer; an affinity ligand useful for carnifected cells; a method of providing to a cell, tissue or organ an anglogenesis-inhibitory amount of HRRG, an HFR domain of HRRG-binding molecule, composition, and enthod of secretic cells; a method of providing or a cell, tissue or organ an anglogenesis-inhibitory amount of HRRG an HFR domain of HRRG-binding site or receptor, from a complex mixture. The expressing HRRG-binding site or receptor, from a complex m proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative 7

```
The invention relates to an isolated tropomyosin (Tpm)-related
antiangiogenic receptor polypeptide or peptide, which is a is a fragment
of a full-length native Tpm protein expressed on the surface of
endothelial cells, or a variant of the fragment. It has a molecular mass
of about 17 kDa and corresponds in its sequence to, or is a variant of,
an internal fragment of a native Tpm isoform which is a binding site for
antiangiogenic polypeptide agents; The isolated antiangiogenic receptor
polypeptide, peptide or variant has substantially the same biochemical
activity of binding to the antiangiogenic polypeptide agent that
contive Tpm internal fragment. The antiangiogenic polypeptide agent that
activity of binding to the antiangiogenic polypeptide agent that
contive Tpm internal fragment. The antiangiogenic polypeptide agent that
contive Tpm internal fragment, the antiangiogenic polypeptide or peptide is human histidine-proline
contive Tpm internal fragment, abbit HPRG, a Tpm-binding, antiangiogenic
conditions are using to the antiangiogenic receptor polypeptide or peptide,
antiangiogenic homologue, variant, domain or fragment of the HK or its D5
antiangiogenic homologue, variant, domain or fragment of the HK or its D5
antiangiogenic nompositions are useful for inhibiting endothelial cell
migration, invasion, proliferation or angiogenesis, for inducing
                                                                                                                                                                     ö

The present sequence is a peptide encoded by one such probe. The SENPS are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
            retinopathy, neovascular glaucoma, uveitis, endometriosis, arthritis, psoriasis, or scleroderma. The antibody may be also used for detecting the presence of a Tpm polypeptide or peptide in a biological sample, for promoting wound healing, or for treating diseases or conditions in which increased angiogenesis is desired, e.g. coronary artery disease or peripheral artery disease. The present sequence represents a human HPRG protein His-Pro (H/P) rich domain.

The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                               Peptide #11762 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein #8752 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      single exon nucleic acid probes useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.

                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                              measuring human gene expression in gample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                       exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                       The present invention relates to single exon nucleic acid probes for

                                                                                                                      n genome-derived single exon nucleic acid probes useful for analyzing expression in human bone marrow.
                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; brain expressed exon; gene expression analysis; probe; microarray;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human brain expressed single exon probe encoded protein SEQ ID NO: 36887.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                  ö
          diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      exon nucleic acid probes useful for analyzing

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung acid expression in a sample derived from human lung the label detectably bound to each probe of the mrany; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene,

comprising (a) identifying exons from genomic sequence by the method
above and (b) measuring the expression of each of the exons in several
tissues and/or cell types using hybridisation to a single exon
microarrays having a probe with the exon, where a common pattern of
expression of the exons in the tissues and/or cell types indicates that
the exons should be assigned to a single gene; a peptide comprising one
of 12011 sequences, mentioned in the specification, or encoded by the
probes/open reading frames (ORF). The probes are used for gene expression
analysis, and for identifying exons in a gene, particularly using human
cancer, chronic obstructive pulmonary disease such as asthma, lung
cancer, chronic obstructive pulmonary fibrosis, neurofibromatosis,
tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
budlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
chistiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
histiocytosis, pulmonary hypertension and hyaline membrane disease. The
present sequence is a peptide/protein encoded by a single exon probe of
the invention. Note: The sequence data for this patent did not form part
of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for detecting 1000 or more all signaling and cell-cell

The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

concoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to polypeptides encoded by the polynucleotides. The invention and to additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; antibodies against polypeptides of the invention; antibodies appentic for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the
                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ä

           vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid comprising any one of

the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained for the car, and the printed specification, but was obtained for the car.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polypeptides and polynucleotides useful for treating and preventing e.g. neurological or epidermal diseases.
                                                                                                                                                                                                                                                                                                             Gap junction protein beta-4; human; neurological disease; epidermal disease; deafness; cataract; AIDS; therapy; diagnosis; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents human gap junction protein beta-4, a protein that has homology to connexins. The invention relates to gap junction protein beta-4 polypeptides and polynucleotides (see also AAZ20259), recombinant materials and methods for their production. It also relates to methods for using such polypeptides and polynucleotides for the treatment of neurological diseases, epidermal diseases, deafness, cataract, and AIDS, and for identifying agonists, antagonists and/or inhibitors useful in treating conditions associated with gap junction protein beta-4 imbalance. Also provided are diagnostic assays for detecting diseases associated with inappropriate gap junction protein beta-4 activity or levels, e.g. by analysing for the presence or amount of polypeptide expression in a sample. The polypeptides are also useful for raising antibodies immunospecific to gap junction protein beta-4

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical corp physiological responses in a cell, tissue, organ or organism.

Corp physiological responses in a cell, tissue, organ or organism.

Corp diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of diagnostic and independent of modulate their corp. The NOVX polypeptides, polymucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, anner and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune disorders, allergies, blood disorders, acquired immunodeficiency syndrome disorders, allergies, blood disorders, acquired immunodeficiency syndrome condisorders, and epilepsy. Accordingly, these molecules have many activities including cytostatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, and epilepsy. Accordingly, these molecules have many activities including cytostatic, anti-HIV, antidiabetic, antiarteriosclerotic, antiallergic, naminathmatic, nephrotropic, antiarthritic, hepatotropic, antiathritic, hepatotropic, antiathritic, hepatotropic, antiathritic, nephrotropic, antiathritic, hepatotropic, antiathritic, nephrotropic, antiathritic, hepatotropic, an
                                                                                                                                                                                                                                                                                                                            CE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical or physiological responses in a cell, tissue, organ or organism.

Corpectifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of diverse pathological conditions. The present invention describes novel numan and murine NOVX proteins, as well as methods to modulate their carpression using antisense oligos, ribozymes and peptide nucleic acids.

CC The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune CC treating or preventing diseases such as inflammation, autoimmune cc disorders, allergies, blood disorders, acquired immunodeficiency syndrome (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy and epilepsy. Accordingly, these molecules have many activities including cytostatic, antidiabetic, antidiatherities, antidiabetic, antidiathematory, immunosuppressive, antiallergic, antidiathematic, nephrotropic, antidatherities, distant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, contropic, antiarthritic, the molecules that modulate or inhibit, for example, or elections, wound healing and angiogenesis. The nucleic acids are also the phasimancements. This polypeptide is a homologue of a human NOVX protein
                    New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Š
                                                                                                                                The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is 80 % identical to a contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is 80 % identical to a cancer-associated proteins given in ABR48146 to ABR48242). Bladder cancer-associated proteins given in ABR48146 to have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                         ö
                                                             patient, comprises contacting a biological sample from the patient with a bladder cancer-associated polynucleotide or antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lung cancer-associated polypeptide; cytostatic; emphysema; atelectasis; antiinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polyneptide are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated polypeptide, for cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, emphysema, bronchitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer-associated polypeptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lung cancer-associated polypeptide, cytostatic; emphysema; atelectasis; antiinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.
                                                                                                         Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 273;

                                                                                                                                                                                The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful of the cancer in cancer, such as small cell lung cancer, non-small cell ung cancer, other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer-associated polypeptides of the inverse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 o;

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
ther diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising a
nucleic acid of the invention; use of such antibodies for drug targeting;
and methods of screening for modulators of activity or expression of the
polypeptides and mucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
neovascularistaion syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present
sequence represents a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; differential expression; cancer; angiogenic disorder; fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis; inflammatory disease; autoimmune disease;

```
The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising a
nucleic acid of the invention; use of such antibodies for drug targeting;
onlypeptide of the invention; use of such antibodies for drug targeting;
and methods of screening for modulators of activity or expression of the
polypeptides and mucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
neovascularistaion syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present
sequence represents a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   esence or absence of a pathological cell in a patient, ing, prognosing or treating cancer, comprises detecting
retinal neovascularistaion syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis; drug screening; drug targeting; wound healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Glynne R, Hevezi

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                            detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                       This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential data of the genome of such organism, selecting at least arbitrary region in the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly thermococcus kodakaraensis KOD1. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the disruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived using the method of the invention. Note: The sequence data for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                     Method for disrupting targeted gene in genome of organism particularly thermostable bacterium and with genome chips for analysis, applicable in studying gene structure and functions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     using the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL6175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the improved plant properties, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of nor plant disease, better growth rate by modification of the coll cycle pathway with plant growth regulators, increased rate of content, improved plant growth and development under at least one stress content, improved lignin production of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved lignin production or improved galactomannan conduction. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic correct form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                           promoter positioned to provide
                                                                                      New recombinant DNA construct comprising a promoter positioned to provi
for expression of a polynucleotide encoding a polypeptide from a
microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               r detecting 1000 or more signaling and cell-cell
                                                                                                                        solated nucleic acid detection reagent for detecting 1000 or more from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent

    The invention is
capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present sequence is the protein sequence of human histidine proline rich glycoprotein (HPRG), a proteinaceous metal chelator that can be used to rich glycoprotein (HPRG), a proteinaceous metal chelator that can be used to phypeptides or peptides comprise: the histidine-proline-rich (H/P) domain (see ABB79806) of human HPRG; an H/P domain of rabbit HPRG (see ABB79807); a variant of these that is capable of inhibiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808.

Also claimed are: chemically synthesised or recombinantly produced peptide multimers; a diagnostically or therapeutically labeled antiangiogenic polypeptide, peptide or peptide multimer; a diagnostically useful HPRG-related composition, comprising the diagnostically labeled polypeptide, peptide multimer and a carrier; an antibody specific for an epitope of HPRG that is present in the H/P domain of human or rabbit HPRG, and which binds to HPRG or to any of the domains in a way which inhibits the anti-angiogenic activity of HPRG or the domain, New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis. Claim 1; Page 11; 82pp; English P-PSDB; ABN84910

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The ABO84396 represent P. aeruginosa polypeptides of the invention.

this patent did not form part of the printed was obtained in electronic format from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2, Application US/09809657

Sequence 2, Application US/09809657

Patent No. 6734022

GENERAL INFORMATION:
APPLICANT: HUTCHENS, WILLIAM
APPLICANT: YIP, TAI-TUNG
APPLICATION NUMBER: US/09/809,657
CURRENT FILING DATE: 2001-03-15
PRIOR FILING DATE: 1993-05-28
NUMBER OF SEQ ID NOS: 2
SOFTWARE: Patentin version 3.0
SEQ ID NO 2
Sequence 2, Application US/09742494

Sequence 2, Application US/09742494

Batent No. 6528320

GENERAL INFORMATION:

APPLICANT: HUTCHENS, WILLIAM

APPLICANT: YIP, TAI-TUNG

TITLE OF INVENTION: METHODS AND APPARATUS FOR DESORPTION AND IONIZATION OF ANALYTES

FILE REFERENCE: P00798USE/09306611

CURRENT APPLICATION NUMBER: US/09/742,494

CURRENT FILING DATE: 2000-12-20

NUMBER OF SEQ ID NOS: 2

SOFTWARE: Patentin version 3.0

Sequence 666, Application US/09949016

Patent NO. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE REFERENCE: CL001307

CURRENT FILING DATE: 2000-04-14

PRIOR FILING DATE: 2000-10-20

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOFTWARKE: FastSEQ for Windows Version 4.0

SEQ ID NO 6606

LENGTH: 273
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 9101, Application US/09949016

APPLICANT: Pyati, Jayashree
TITLE OF INVENTION: DNA encoding human acid-
TITLE OF INVENTION: channel BNaC4 (ASIC4)
FILE REFERENCE: ORT-1197;
CURRENT APPLICATION NUMBER: US/09/518,959;
CURRENT FILING DATE: 2000-03-03;
NUMBER OF SEQ ID NOS: 9;
COSTWARE: PatentIN Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           , ORGANISM: Pseudomonas aeruginosa

i Sequence 10688, Application US/09489039A

j Patent No. 6610836

i GENERAL INFORMATION:

i APPLICANT: Gary Breton et. al

i TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS

i FILE REFERENCE: 2709.2004001

i CURRENT APPLICATION NUMBER: US/09/489, 039A

CURRENT APPLICATION NUMBER: US 60/117,747

PRIOR FILING DATE: 1999-01-29

i NUMBER OF SEQ ID NOS: 14342

i SEQ ID NO 10688

LENGTH: 76
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Sequence 57094, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 57094

LENGTH: 84

Sequence 653, Application US/09640211A;
Patent No. 6833446;
GENERAL INFORMATION:
APPLICANT: Wood, Marion
APPLICANT: Shenk, Michael A.;
APPLICANT: Glenn, Matthew
TITLE OF INVENTION: Modification of Gene Transcription;
TITLE OF INVENTION: Modification of Gene Transcription;
FILE REFERENCE: 11000.1021C1U
CURRENT APPLICATION NUMBER: US/09/640,211A
CURRENT FILING DATE: 2000-08-16
NUMBER OF SEQ ID NOS: 2368
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 653
LENGTH: 99
TYPE: PRT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 99;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 31; DB 4; Length 92;
